**04** Results

**05** Conclusion

**06** Further contributions

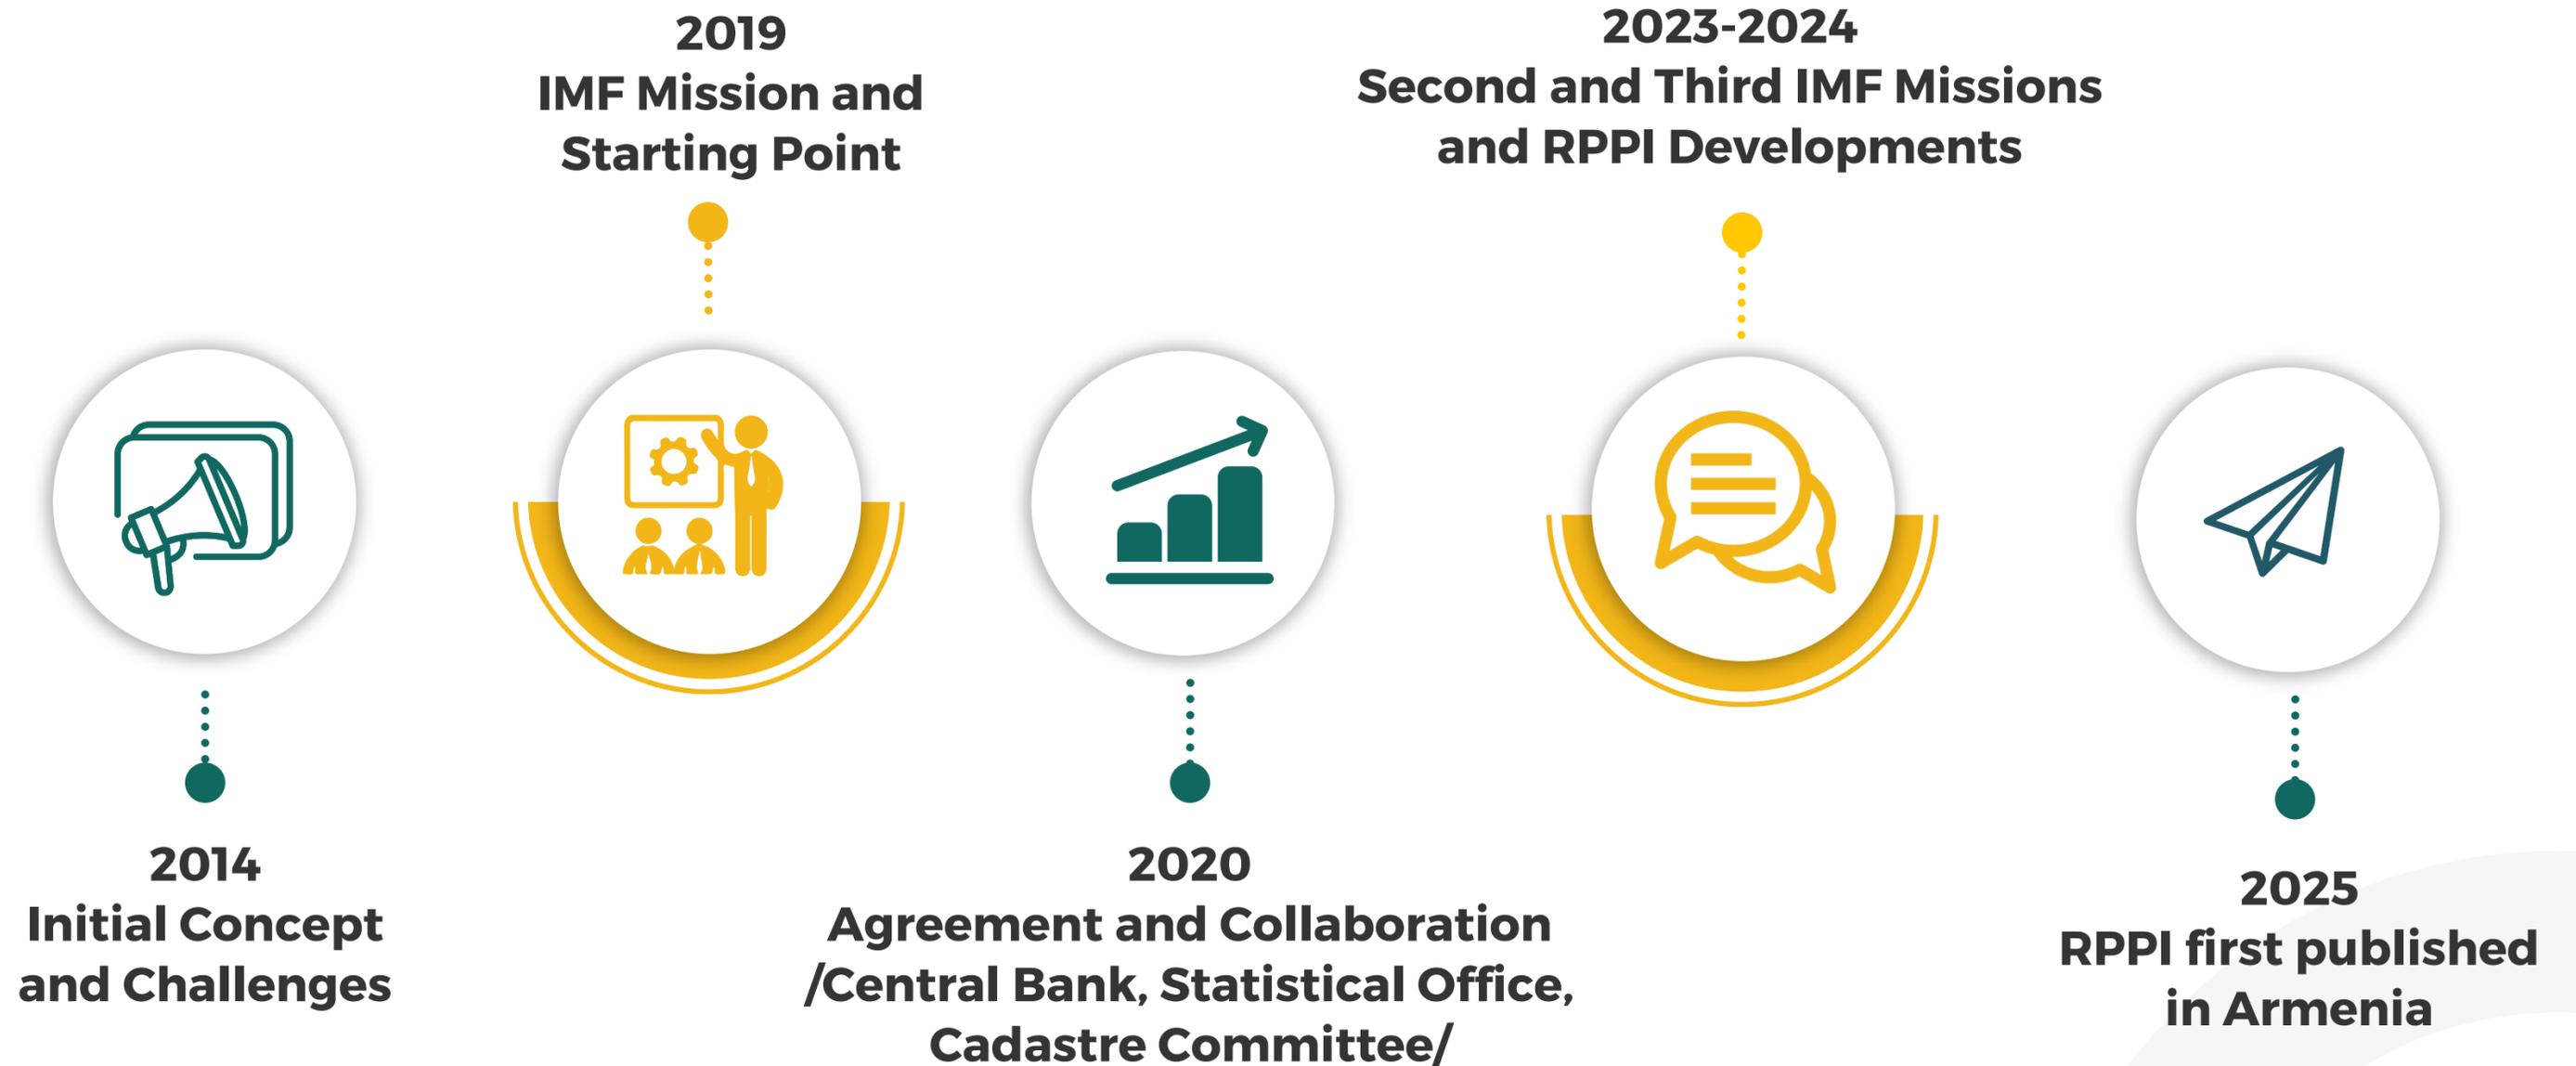

# OBJECTIVES

**Internationally comparable RPPI for Armenia that can support policymakers and investors:**

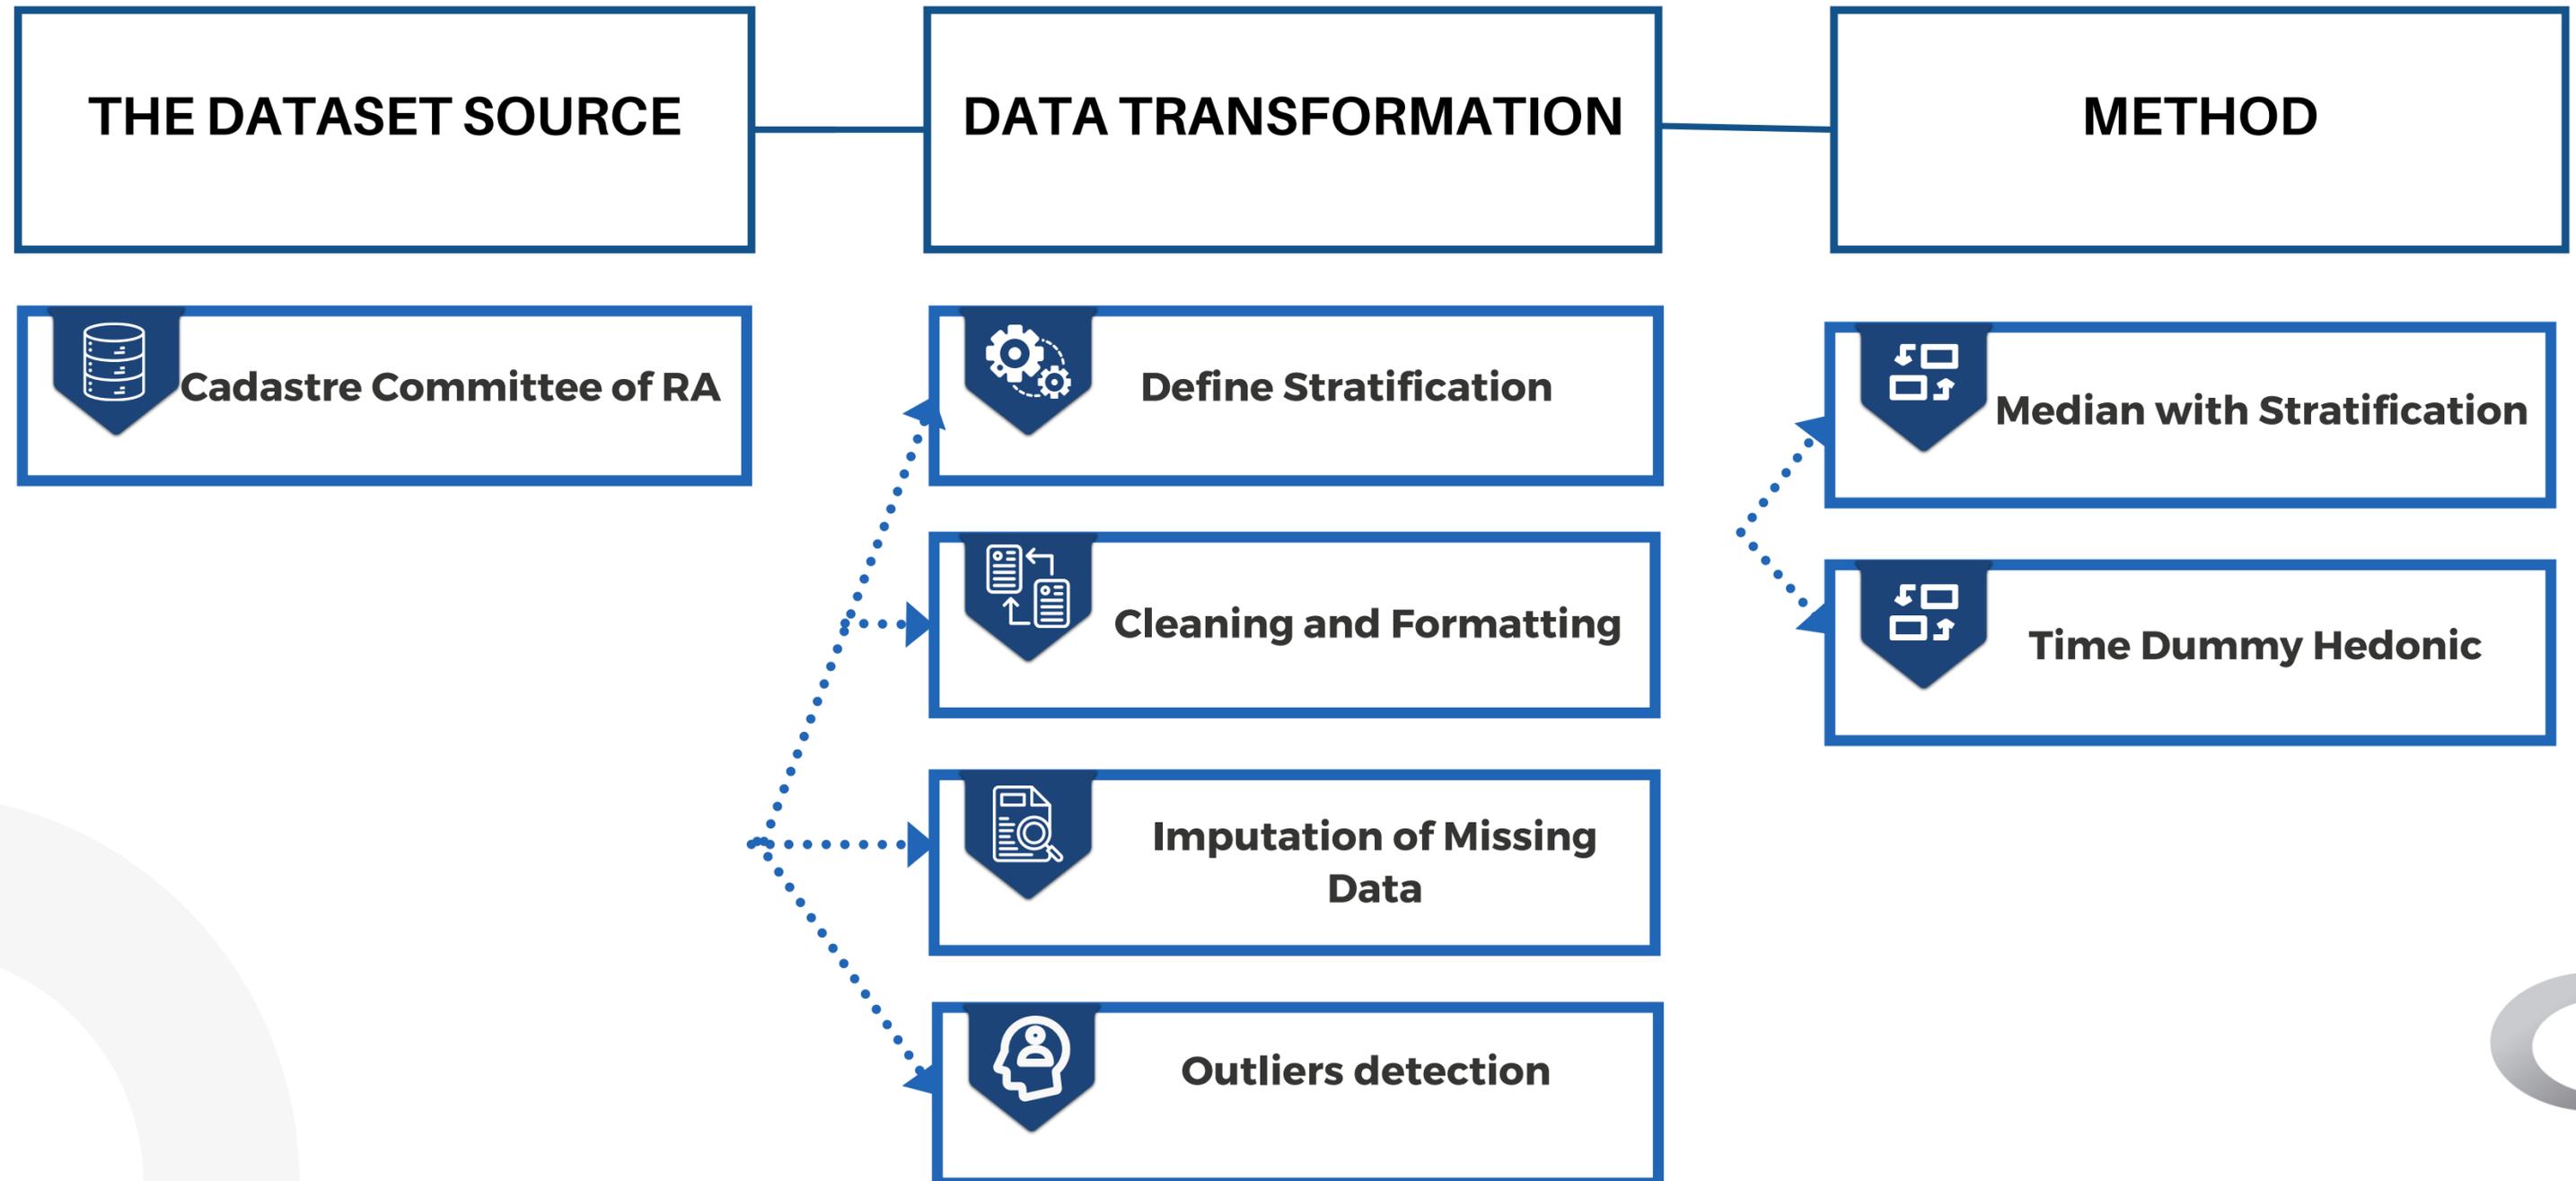

**Assessing inflation-related risks**

**Identifying vulnerabilities in the banking system**

# DEVELOPMENT JOURNEY

# DATA AND METHODOLOGY

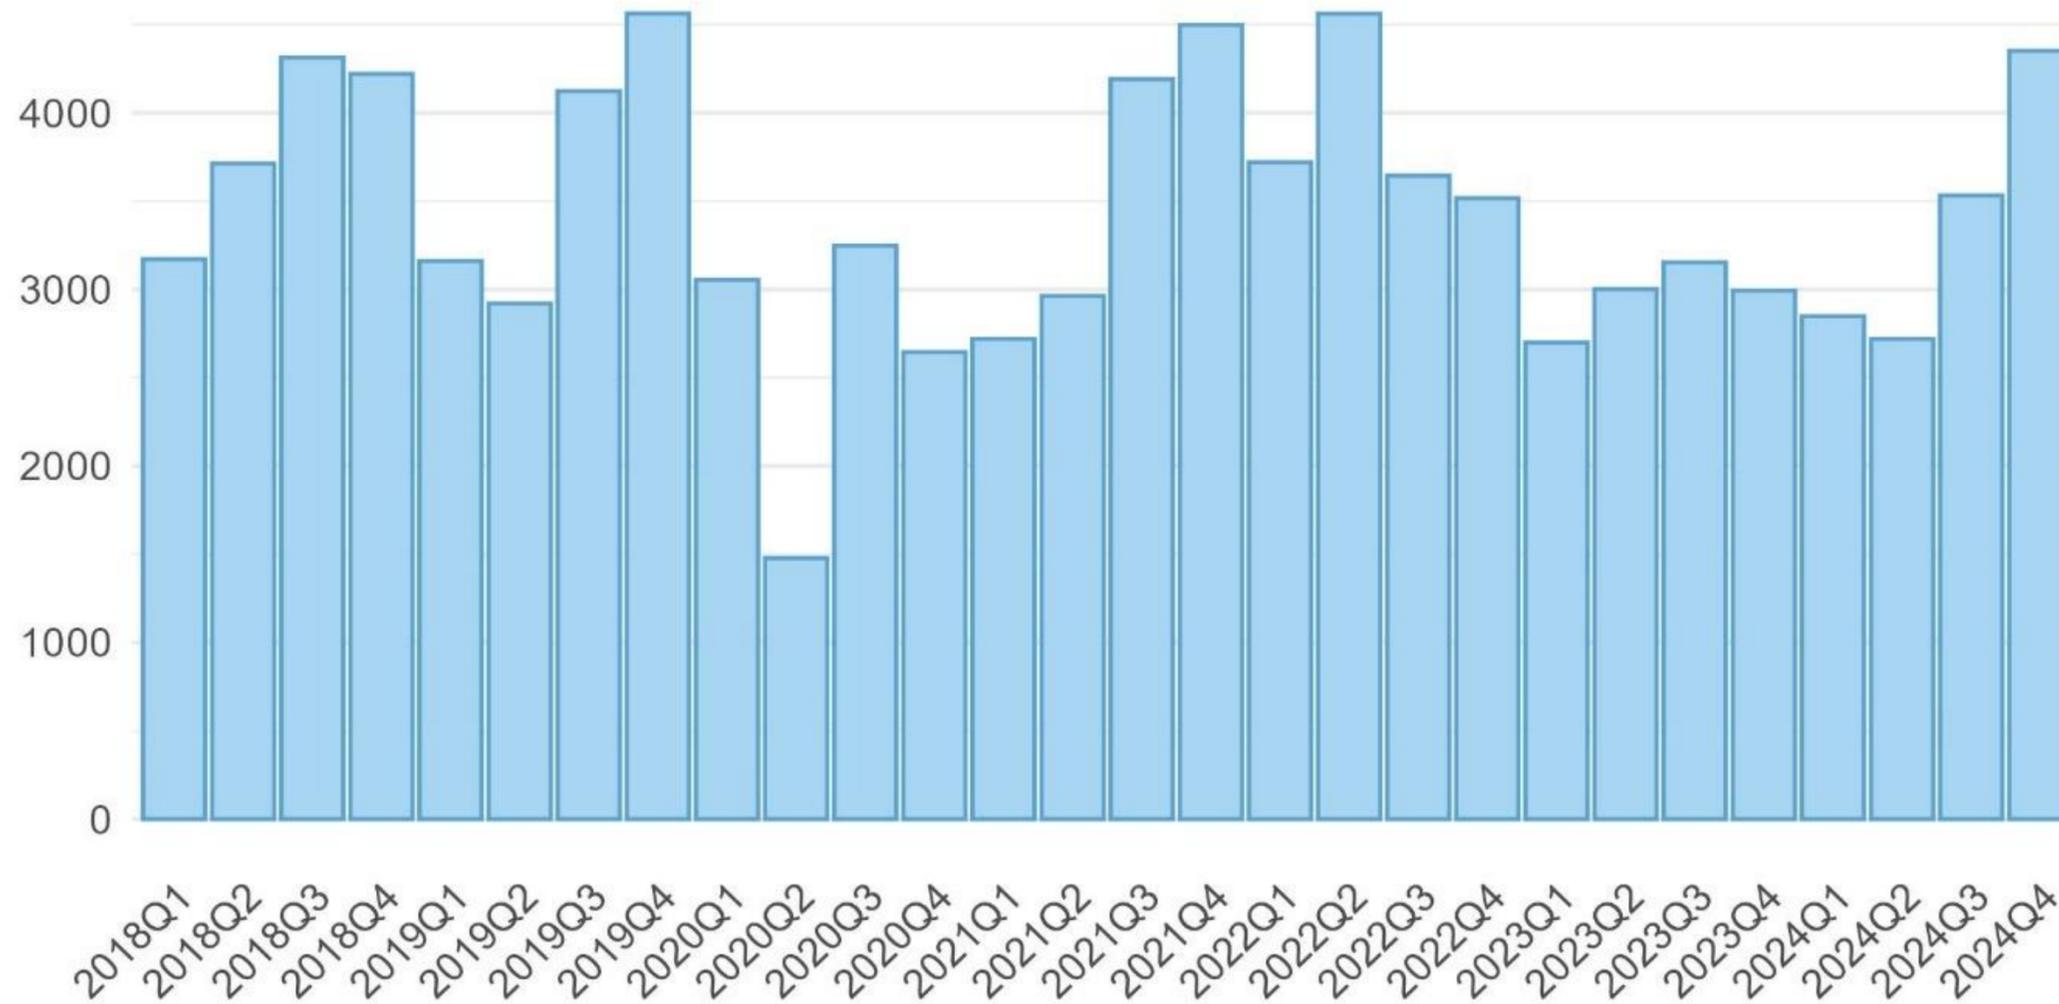

# DATA AND METHODOLOGY

**TABLE 1.** The characteristics which are used in TDH method for apartments

Characteristics	Description
Build_year	<i>The year of construction of a building</i>
Cons_material	<i>Construction material of a building</i>
Floor_Area	<i>Total area in squared metres</i>
Region	<i>The marz where the apartment is located</i>
Zone	<i>Appraisal Zones based on characteristics of the geographical area</i>
Floor_level	<i>Floor level of apartment in the building</i>
Quarter	<i>The dummies for the time period</i>

# DATA AND METHODOLOGY

**FIGURE 1.** Total number of transactions for apartments in each period

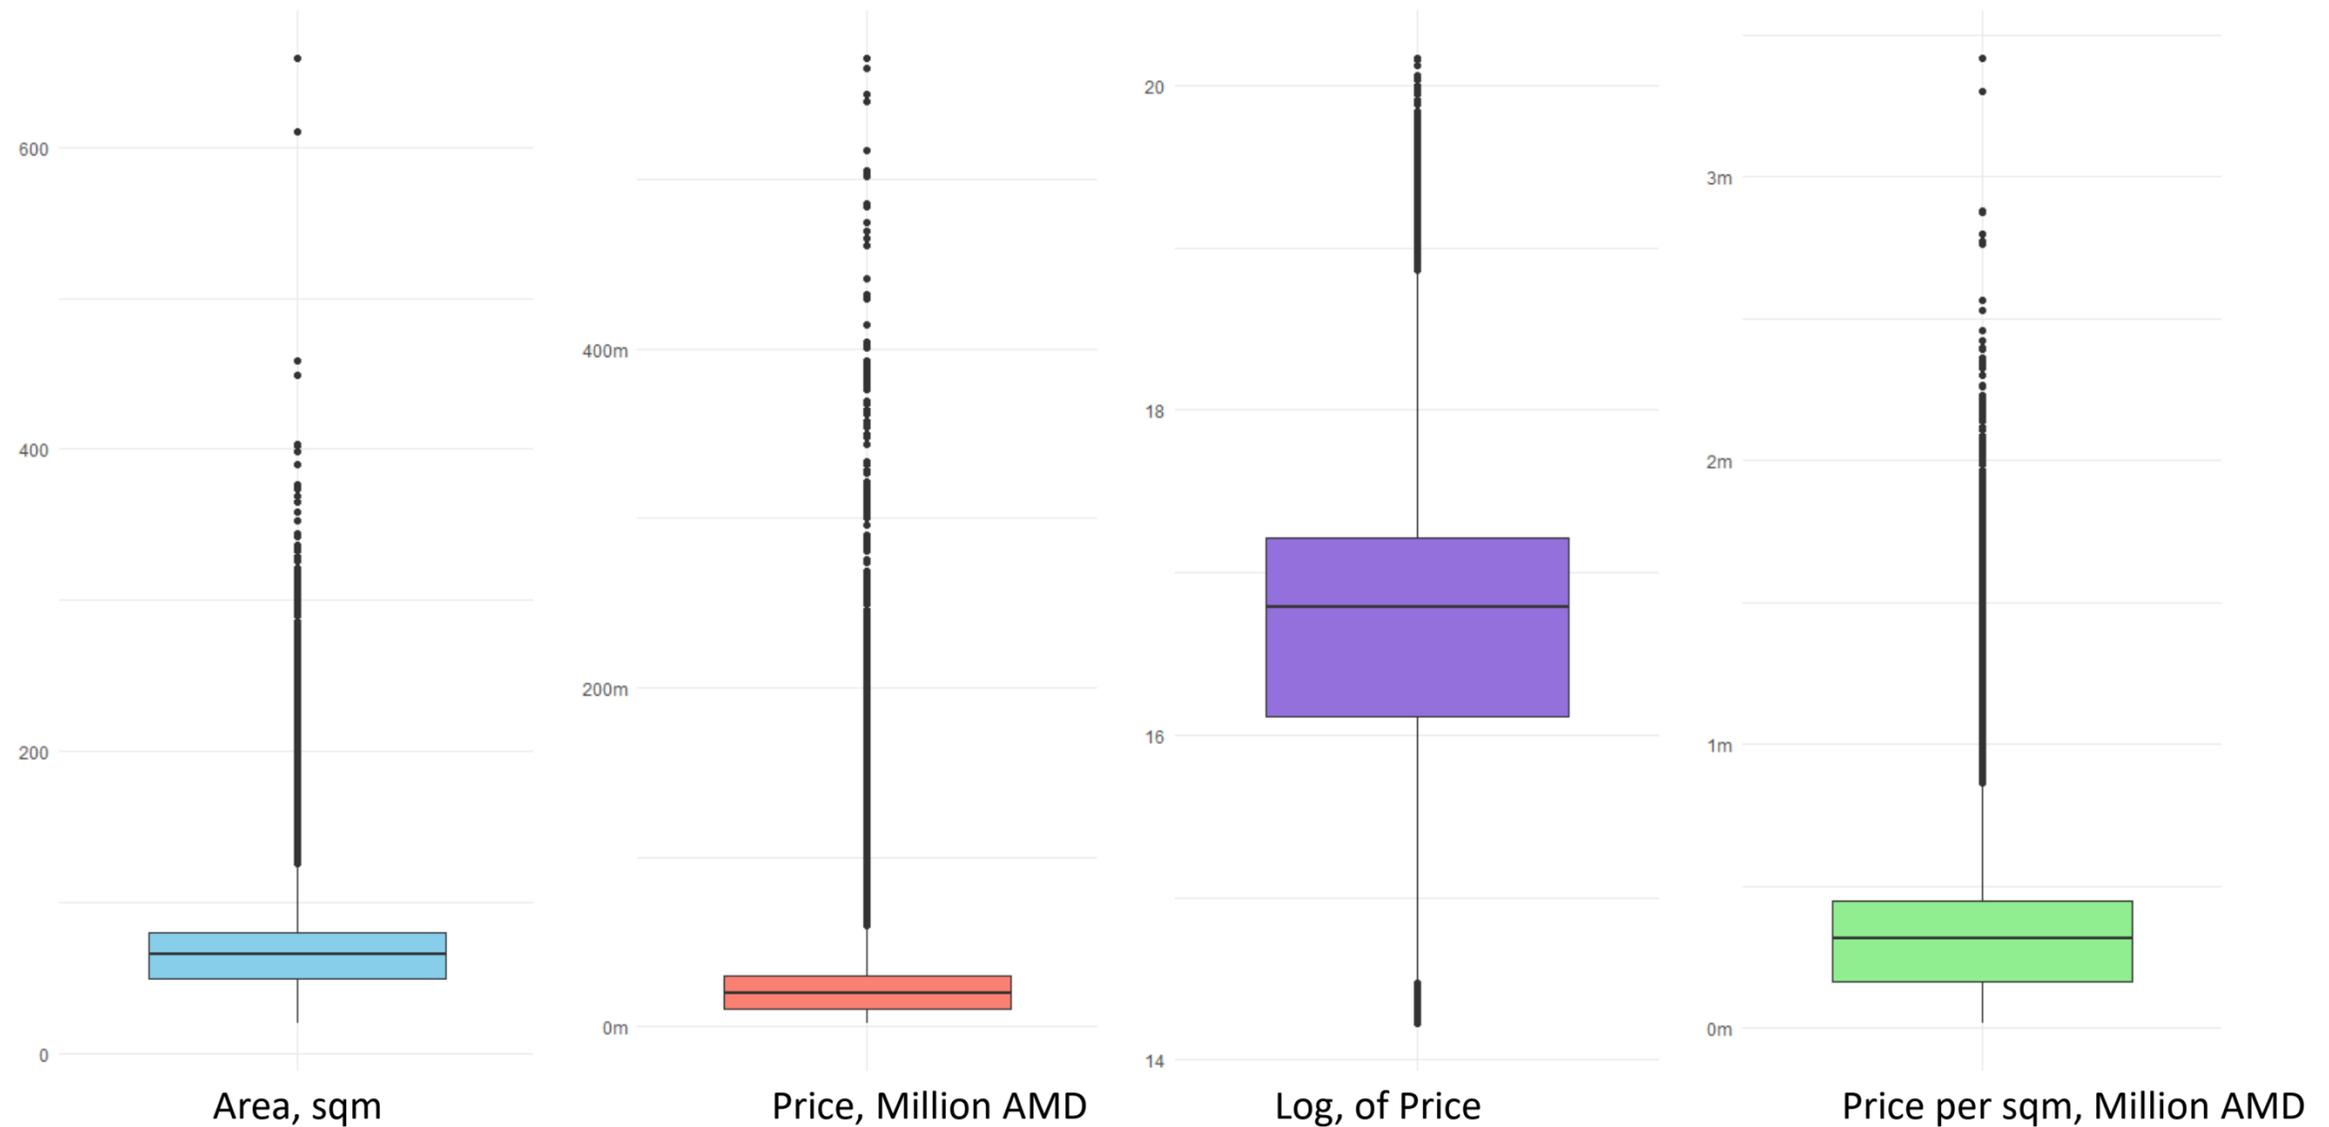

# DATA AND METHODOLOGY

# DATA AND METHODOLOGY

## TIME DUMMY HEDONIC METHOD

$$\ln p_n^t = \beta_0 + \sum_{t=1}^T \delta^t D_n^t + \sum_{k=1}^K \beta_k Z_{nk}^t + \varepsilon_n^t, \quad \text{where}$$

$t$  – period, where  $t = 0, \dots, T$

$n$  – dwelling  $n$ ,  $n = 1, \dots, N$

$k$  – characteristic,  $k = 1, \dots, K$

$\ln p_n^t$  – natural logarithm of dwellings  $n$  price

$\beta_0$  – intercept

$\delta^t$  – coefficient of periods  $t$  time dummy variable that will generate the index

$D_n^t$  – time dummy vector that is one in period dwelling  $n$  is transacted, and zero otherwise

$\beta_k$  – “shadow” price of characteristic  $k$

$Z_{nk}^t$  – quantity of characteristic  $k$  in period  $t$  and dwelling  $n$

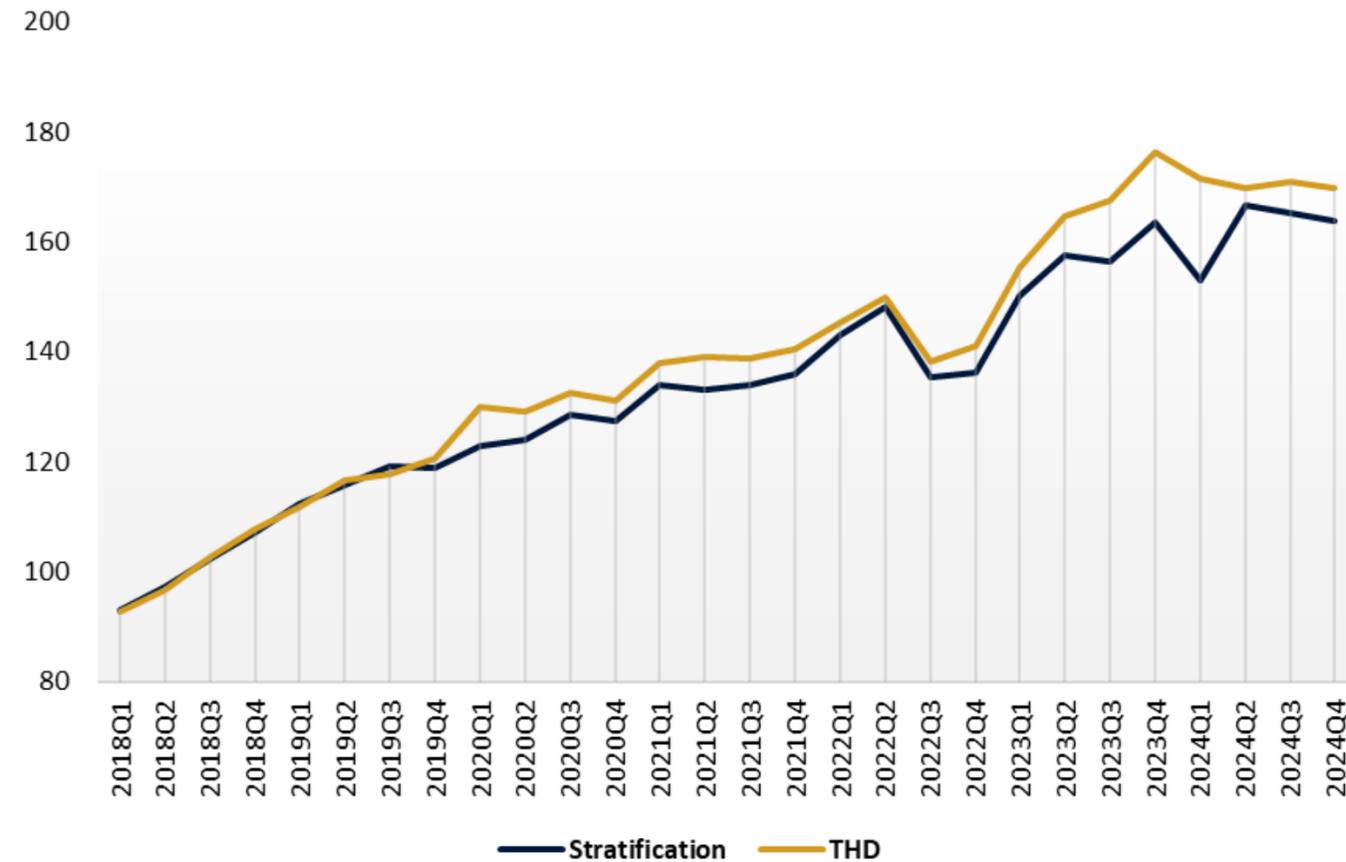

$\varepsilon_n^t$  – dwelling specific error term.

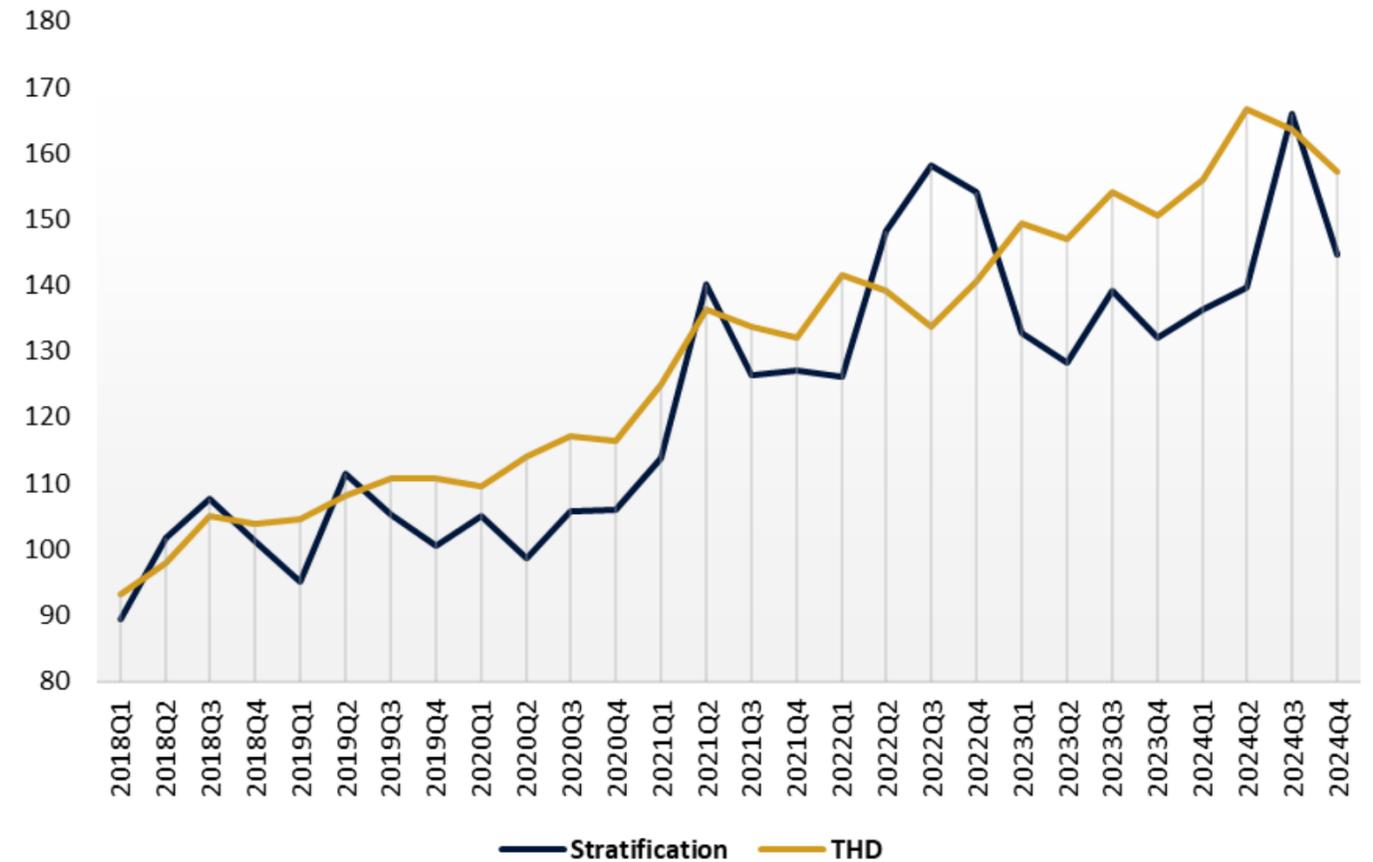

# RESULTS

# CONCLUSION

Among various available data sources, the CCA dataset has been selected because of its full coverage, including all transactions, a rich set of appropriate characteristics for apartments and individual houses, and the timeliness.

Time-dummy hedonic regression method was selected because it incorporates a larger set of characteristics and thus offers a stronger ability to capture for quality changes over time.

The national index is further split into two sub-indices for apartment and individual houses. Due to the better quality characteristics for apartments, this segment is additionally split into two main strata.

# FURTHER CONTRIBUTIONS

Collaboration with Cadaster committee to expand and develop dataset for compilation of separate sub-indices for new and existing residential properties and separate indices for individual houses at the region level.

Utilizing web-scraped data for timely and high-frequency RPPI estimates.

Exploring the launch of a CPPI for a complete market perspective.
